

Flow Chart

Begin converting name (normally) to ASCII
table Hexadecimal

Realize I was supposed
to turn name lower case
first

Find highest number in binary that birth year,
2004 would fit into, 1024.

Now I know I'll need 11 digits and 12^{th} would be 0.
Begin dividing 2004 by 2 and keep track of
remainders

Turn remainders into Binary
representation where the first
remainder would be the 1st
digit.

Combine my Hex name
and binary DOB year.
