

CISC 211 Loops & Arrays

Hw 5-2/2 Flowchart

Create file: loopArr.asm

↓
update my server again
sudo apt update
Install nasm
Install gdb

↓
Create counter for task 1
- start ecx, 10 ; go to 10
- counter to 0

↓
Loop
- increment counter
- decrement ecx, until == 0
- store loop result

↓
Task 2 Fibonacci num
- create first two nums
- set increment total
- to loop
- temp
- add the last two nums
- shift them all back
- decrement total/counter
- loops till counter == 0
- store result

Task 3

set array length counter
set array address
set first num

Loop
- cmp current num to
curr largest

- skip if not
- if so, update new
largest

next-elem:

- go to next by going up
4-bytes, next dd
- decrement count
- run loop

↓
store largest

↓
finish the
set up of the
data & .bss

↓
Test gdb?

Task 1

ECX count down
EBX count up

Watch point triggers

task 1 - ebx = 10

Task 2

EBX counts

each fib num

to 55, then 88

but cancels that.

"fib-result

= 55

Task 3

Watch ECX

increment by 4 bytes

Watch point

largest = 82

(correct)
